

Create a simple web parser. Web parser should parse specific page by specific params and display results using ajax on current page.

Web parser should contains:

- Main page with 2 input fields
 - Input 1 should be address to parse
 - Input 2 should be a “item” which to parse from given address. E.g. ‘css selector’
 - Button “submit”
 - For example
 - Input 1 will contain this [url](#)
 - Input 2 will contain #searchlist-items .item.extend.featured
 - On submit, ajax call will trigger and results will be displayed under form.

Back-end must be written in object PHP with using MVC structure. There is no need for SQL.

Results must be provided by GITHUB Link.

<document end>
