

## **Task description**

Imagine we have an online store where we offer other shops to sell through us. Then we offer this shop ability to set up their delivery methods. This task requires from candidate to create this delivery methods form.

Delivery methods are pulled from database, then displayed in form. Every delivery method can have no value, value as zero, value as price, and ranges. No value means method is unavailable, value as zero means delivery method is free, value as price means delivery method has it's price and if ranges are set, then for every range there is specific price. Every delivery method has it's options which is displayed when clicked on "show options"

There are no mandatory fields.

**So main task is to create a form (image is provided to show how it will look), where we can edit delivery methods (ranges/options)**

## **Requirements**

Please create this form, validate data on both front-end and back-end. You can use any framework, or tools in achieving this task. It is important to use PHP/MySQL on back-end and on front-end HTML/CSS/JS
